

Electromagnetic Spectrum

Electromagnetic Spectrum: Radio Waves, Microwaves, Infrared, Visible Light, Ultraviolet, X-rays, Gamma Rays

Electromagnetic waves are transverse waves that travel through space at the speed of light. They are produced by vibrating electric and magnetic fields. The electromagnetic spectrum is divided into seven regions: radio waves, microwaves, infrared, visible light, ultraviolet, X-rays, and gamma rays. Each region has different properties and uses.

Radio waves are the longest and have the lowest frequency. They are used for communication, such as radio and television. Microwaves are used for cooking and communication. Infrared is used for heating and night vision. Visible light is the only part of the spectrum that humans can see. Ultraviolet is used for tanning and sterilization. X-rays are used for medical imaging. Gamma rays are the shortest and have the highest frequency. They are used for cancer treatment and nuclear power.
