Supplementary document

Welcome to this new decryption. Today, we are tackling a situation that we have all experienced. The day before an exam, the rising stress and a microscopic revision time, say. Come on, let's dive right into the heart of the matter. We will dissect a 30-minute hyper-pragmatic method, in three steps. The goal? Maximize information retention for the big day. In today's program, the basic principle of these 30 minutes, then step 1 to sort, step 2 to train, step 3 to correct, and finally a little recap so that everything is perfectly clear. We start right away with the fundamental principle of 30 minutes. So, let's be honest, this method is not magic. It does not replace weeks of regular work. On the other hand, it offers an absolutely unbeatable return on investment. But before starting the clock, you have to ask yourself a crucial question. What's the worst mistake you can make during a last-minute overhaul? It is a chasm in monumental time. And the craziest thing is that the majority of students fall into the trap without even realizing it. And it happens from the very first seconds of revision. In fact, two methods clash. On the one hand, we have the famous chronological reading. We open the notebook on page 1 and read, in order. The problem? We waste a lot of time on things we already know. It gives a false illusion of mastery, and above all, we arrive completely emptied in the face of real difficulties. On the other hand, strategic sorting does the exact opposite. We directly target the weak points to inject all the energy we have left. For this sorting to be effective, the equipment is ultra-minimalist. You need the course book, a blank sheet of paper, a classic pen and another pen of a flashy color for corrections. And there, beware, absolute prohibition to use a highlighter. Zero highlighter. Why? Well, because highlighting gives the impression of acting. But it remains completely passive reading. And passivity is the number one enemy of memory. We take action with step 1, sorting. The goal is to clean up. 10 is exactly the number of minutes allocated to this first phase. Not 11, not 12. 10 minutes. This time constraint is great because it forces the brain to go straight to the point and cuts off any desire to procrastinate. The idea is to scan the course and put everything in three mental boxes. I know, I hesitate and I don't know. And the golden rule here, only 10 seconds per notion. Pure instinct, never opening the notebook to check. We trust each other, it's the feeling that takes precedence. During these famous 10 minutes, you have to spot the must-sees. Which is likely to come up for review. The headlines, the exercises done in class, the things the teacher insisted heavily on. But be careful, it is necessary to limit yourself to a list of 5 to 8 key concepts at most. If the list overflows, we regroup. And then we're ruthless. We definitely cross out everything that is in the "I know" category. We forget. The goal is to keep 100% of the energy for what sticks. Which brings us to step 2. Practice blindly. This is where the magic happens. 12 minutes. This is the time allotted for this phase of mental strength training. This is really the core of the reactor. The precise moment when connections solidify in the brain. So, how do we do it? It's very mechanical. 1. The notebook is completely closed. 2. We take his blank sheet and write everything that comes to mind on the notions of our list. Definition, diagram, formula. Empty your bag. If we block, no matter, we leave a blank and move forward. 3. Once the effort is over, we finally open the notebook. And we take out the famous colored pen to correct. This color, it will bring out exactly what was cruelly missing. That's where the real work is. There is a quote in our source that sums it up perfectly. Understanding by reading is not knowing how to do it again alone. And that's a dreadful trap. When we line correction, we often say to ourselves that it makes sense, that we have understood. Except that on D-Day, there will be no correction under the eyes. The only real proof that we have mastered a subject is to be able to redo it from a completely blank sheet of paper. Let's take a small practical case, like a physics check on Aume's law. The notebook is closed, U is scribbled equal to R times I from memory, and an exercise is attempted. And there, paf! We realize that we have completely forgotten to convert milliamperes into amperes. The classic thing that loses a lot of points. Reading the course passively, we would never have seen this detail. But with the blind active reminder, the mistake is obvious. We correct it, we repeat a similar exercise with other values, and if it passes, hop! The notion is locked for the next day. We now move on to step 3, correct, the final consolidation step. Eight minutes left on the clock. The idea here is not to start rereading your course in panic, but rather to forge the absolute secret weapon that will be used just before entering the exam room. And that secret weapon is the famous mini-card. Less than half a page. Please note, this is not a summary of the course. It's a real treasure map of personal mistakes. We only put in what was planted in the previous stage. The little conversion forgets and the formula is flayed. On the one hand, the trap, on the other, the solution, clearly visible in colour. And to be absolutely sure that this mini-card is shielded, we move on to the explanation test. The concept? We read the card aloud, as if we were teaching a third party. It can be a parent, a brother or even his cat if necessary. Simply articulating and explaining these ideas out loud, but immediately light, which is not clear. If we stumble over words, it is because the notion is not yet fully mastered. It's time to move on to the final recap of our method. We

summarize the choreography of this half hour. Minute 0, we sort to isolate the 5 to 8 fragile notions. 10 minutes later, we dive into the pure training and the intense effort of blind restitution. In the 22nd minute, we use the remaining time to correct and create this famous mini survival card. And at 30 minutes, it's done. It's clinical, it's organized and the efficiency is formidable. So, we end this analysis with a small question to ponder for the next review evening. Is it better to choose the ease of passive reading, with its false illusion of skills, or to have the courage to face the method of active recall, certainly a little more uncomfortable at the time, but which will literally engrave the information in the memory? Maybe it's time to change your approach. Thank you for following this decryption and see you soon.
